

TUFF-N-NUFF RIP SHIELD INSTALLATION PROCEDURE

Your installers should be advised of the following:

1. Standard RIP Shield rolls are designed to protect service conduits of 2" diameter and smaller.
2. Unroll the desired length of RIP shield next to the ditch
3. Open the RIP shield and place it in the bottom of the ditch
 - a. In a deep ditch application the RIP shield may need to be affixed directly to the pipe with tape or non-metallic strapping before lowering the pipe into the ditch.
4. Lower pipe into the ditch and allow the RIP shield to fold itself over the pipe.
5. 2-3 cm "end to end" overlap of RIP Shield rolls is recommended.
6. Pipeline may be backfilled immediately after installation or within a reasonable timeframe.
